CB23F35: Low-Code Application Development using Zoho Creator

Assignment – 5

Name: Devadharshini G

Register No.: 240701108

AIM:

To design and implement a complete automation layer in Zoho Creator for the Patient Appointment Booking application by using all eight workflow options—Form Workflows, Schedules, Approvals, Payments, Blueprints, Batch Workflows, Report Workflows, and Functions—to automate appointment confirmation, reminders, approvals, payments, status transitions, fee recalculation, and post-visit follow-up.

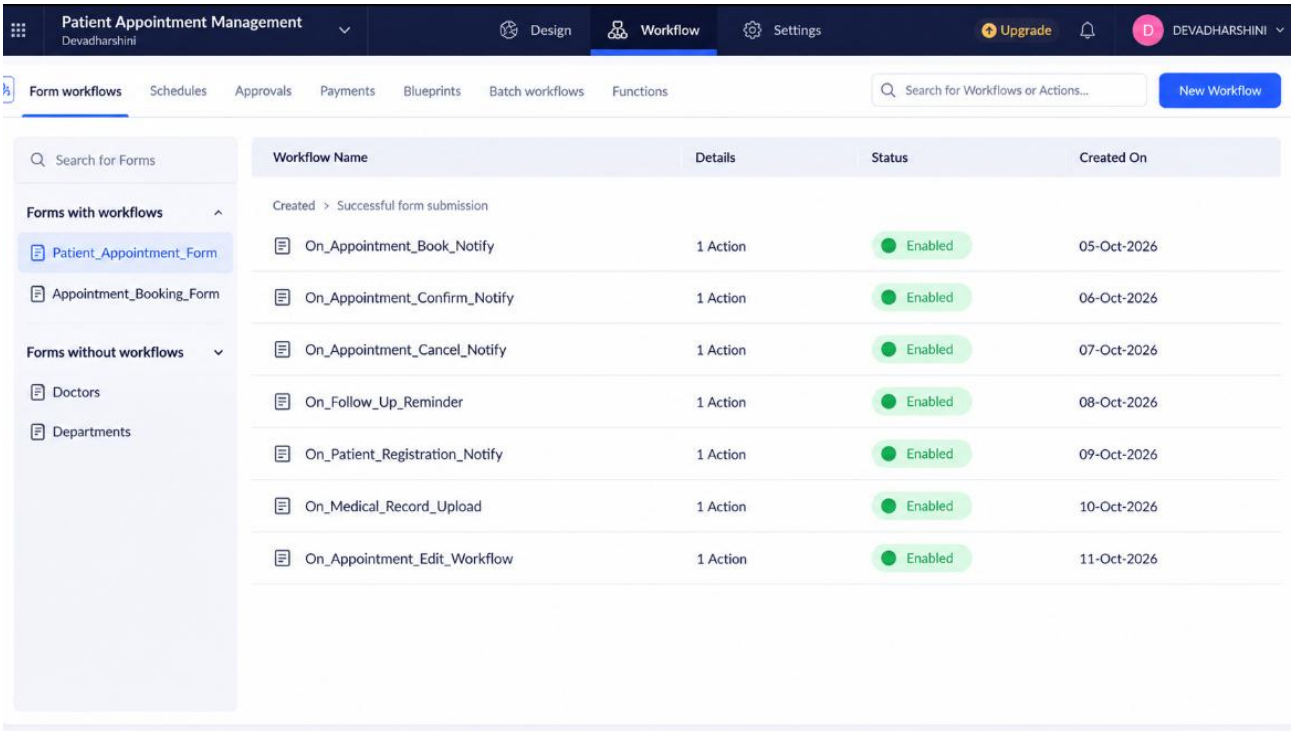

PROCEDURE:

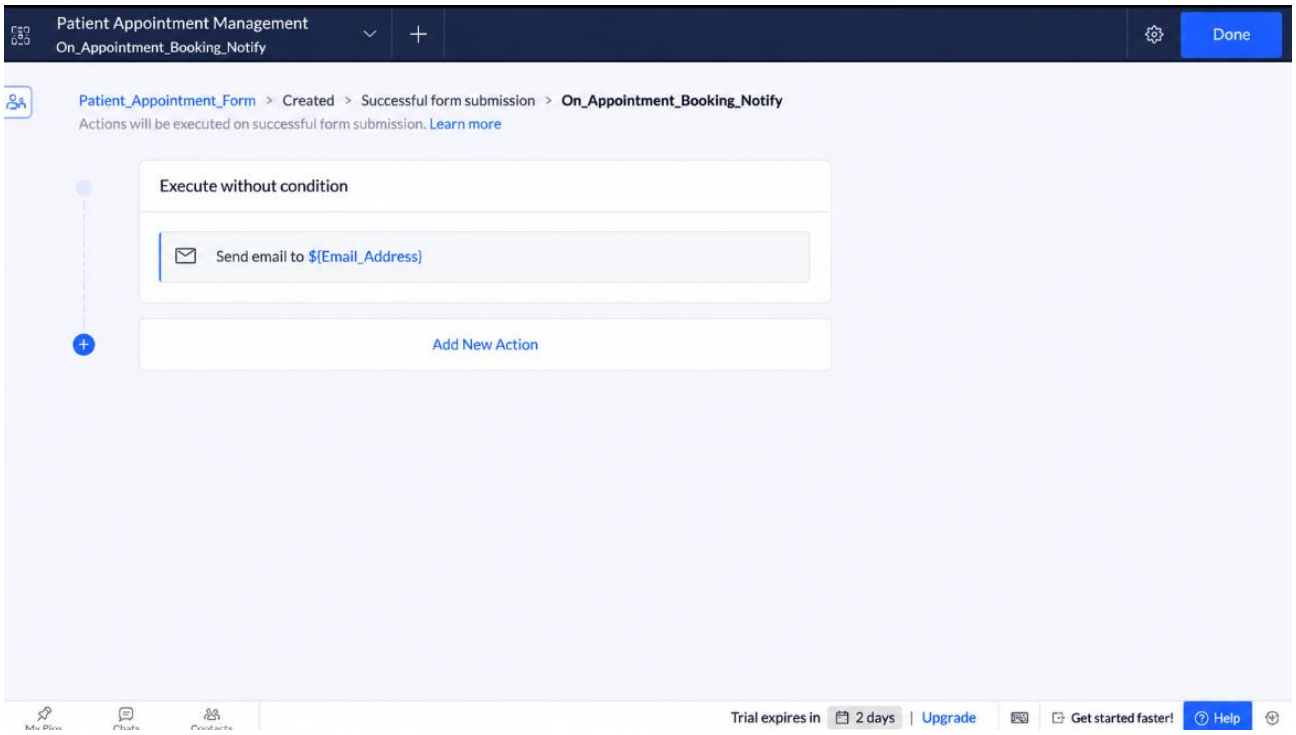

1. Open the existing “Patient Appointment & Scheduling Management” application in Zoho Creator and use the Appointment_Booking_Form and Appointment_Booking_Report as the base.
2. Create the Form Workflow “On_Appointment_Submit_Workflow” to send an immediate confirmation message containing the Appointment ID and visit details to the patient and notify the front desk when a new appointment is submitted.
3. Create the Schedule “Daily_Appointment_Reminder_Schedule” to run daily at 6:00 PM, identify appointments scheduled for the next day, and send reminders containing the appointment time, doctor's name, department, and pre-visit instructions.
4. Configure the Approval workflow “Special_Procedure_Approval” so appointments flagged for special or high-risk procedures are sent to the concerned doctor for approval before the slot is confirmed. Use the department head as a fallback approver if needed.
5. Configure the Payments workflow “Consultation_Fee_Payment_Workflow” to generate a secure payment link based on Net_Payable_Fee and update Payment_Status automatically to Paid on success or flag failed payments for front-desk follow-up.
6. Create the Blueprint “Appointment_Lifecycle_Blueprint” to control the appointment stages: Requested, Confirmed, Checked-In, Consulted, and Cancelled. Restrict transitions by role and require a comment for each stage change.
7. Create the Batch Workflow “Bulk_FollowUp_Reminder_Batch” to run nightly at 9:00 PM, identify patients whose recommended follow-up window is approaching, and send reminders in batches of 150 records.
8. Create the Report Workflow “OnEdit_Recalculate_NetFee_Workflow” to recalculate Net_Payable_Fee when the Consultation Fee or Insurance Coverage Percent is edited in the report. Configure it to run only when either of these fields changes.
9. Create the reusable Deluge Function “Generate_VisitSummary_Function” to generate a visit-summary or prescription PDF after consultation and email it to the patient. Allow it to be

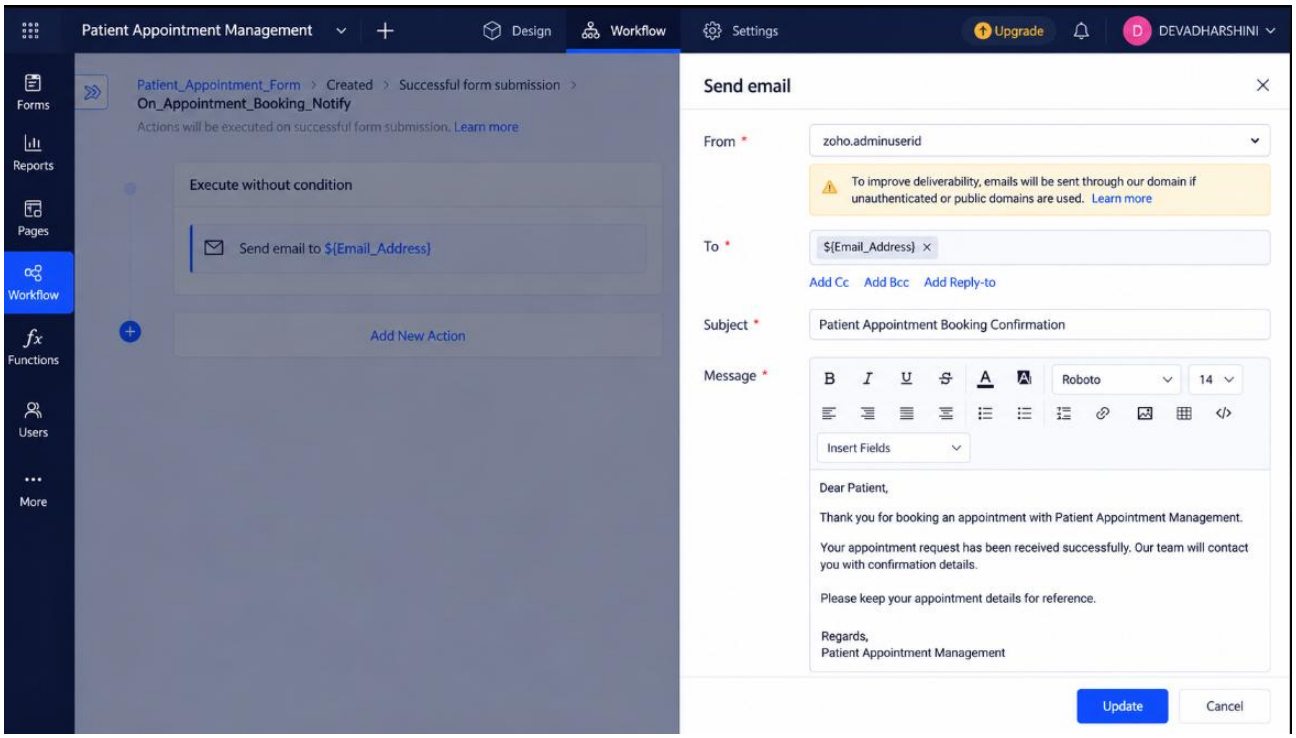

triggered when status changes to Consulted and manually through a “Resend Visit Summary” button.

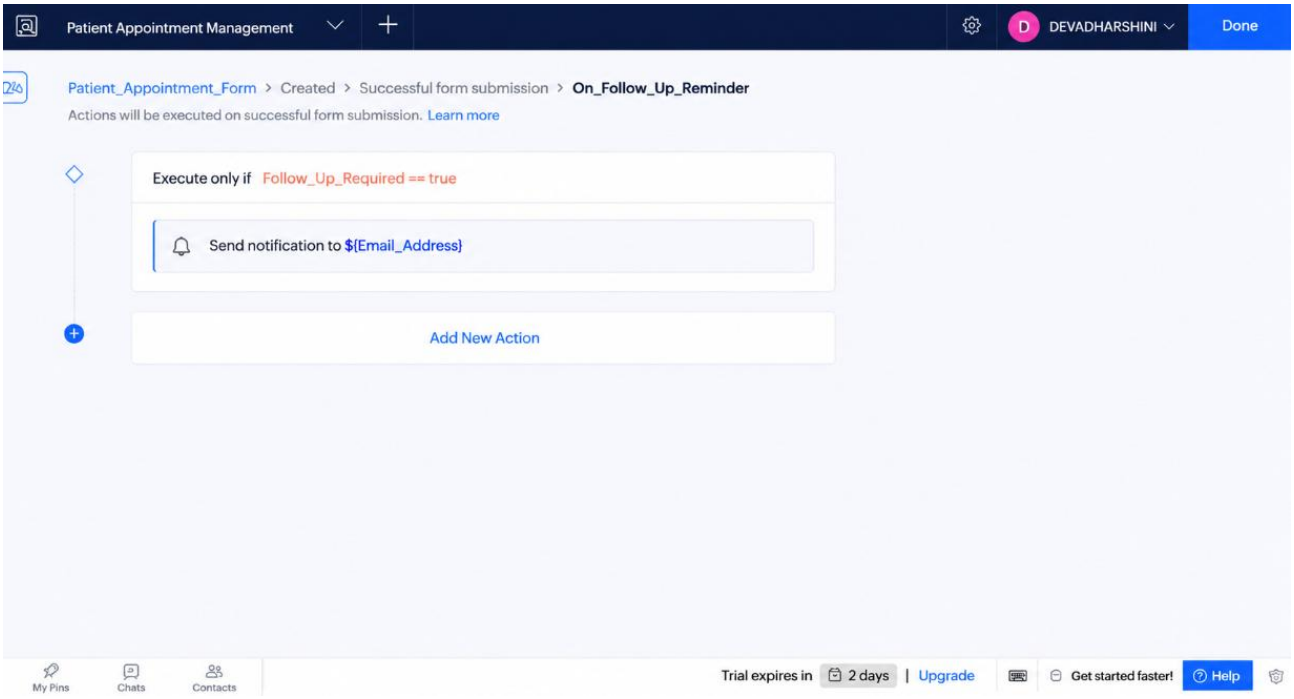

10. Configure governance rules: send only one reminder per appointment, retry payment status callbacks up to three times, use a fallback approver, and validate that the patient name and doctor are present before generating a visit summary.
11. Test all eight workflow options with sample appointments. Verify confirmation messages, next-day reminders, approval routing, payment status updates, Blueprint transitions, batch follow-up reminders, fee recalculation, and visit-summary generation.

RESULT:

Thus, the Patient Appointment Automation Suite was configured in Zoho Creator using all eight workflow options. The automation supports appointment confirmations and reminders, doctor approval for special procedures, consultation payments, controlled appointment status transitions, batch follow-up notifications, automatic fee recalculation, and visit-summary generation. This reduces manual work and helps maintain a more consistent and traceable patient appointment lifecycle.
